Biostatistics 615/815 Lecture 4: User-defined Data Types, Standard Template Library, and Divide and Conquer Algorithms

Hyun Min Kang

Januray 18th, 2011
# fastFishersExactTest.cpp - main() function

```cpp
#include <iostream> // everything remains the same except for lines marked with ***
#include <cmath>

double logHypergeometricProb(double* logFacs, int a, int b, int c, int d); // ***
void initLogFacs(double* logFacs, int n); // *** New function ***

int main(int argc, char** argv) {
    int a = atoi(argv[1]), b = atoi(argv[2]), c = atoi(argv[3]), d = atoi(argv[4]);
    int n = a + b + c + d;
    double* logFacs = new double[n+1]; // *** dynamically allocate memory logFacs[0..n] ***
    initLogFacs(logFacs, n); // *** initialize logFacs array ***
    double logpCutoff = logHypergeometricProb(logFacs,a,b,c,d); // *** logFacs added
    double pFraction = 0;
    for(int x=0; x <= n; ++x) {
        if ( (a+b-x) >= 0 && a+c-x >= 0 && d-a+x >=0 ) {
            double l = logHypergeometricProb(x,a+b-x,a+c-x,d-a+x);
            if ( l <= logpCutoff ) pFraction += exp(l - logpCutoff);
        }
    }
    double logpValue = logpCutoff + log(pFraction);
    std::cout << "Two-sided log10-p-value is " << logpValue/log(10.) << std::endl;
    std::cout << "Two-sided p-value is " << exp(logpValue) << std::endl;
    delete [] logFacs;
    return 0;
}
```

Hyun Min Kang
fastFishersExactTest.cpp - other functions

**function initLogFacs()**

```c
void initLogFacs(double* logFacs, int n) {
    logFacs[0] = 0;
    for(int i=1; i < n+1; ++i) {
        logFacs[i] = logFacs[i-1] + log((double)i); // only n times of log() calls
    }
}
```

**function logHyperGeometricProb()**

```c
double logHypergeometricProb(double* logFacs, int a, int b, int c, int d) {
    return logFacs[a+b] + logFacs[c+d] + logFacs[a+c] + logFacs[b+d]
        - logFacs[a] - logFacs[b] - logFacs[c] - logFacs[d] - logFacs[a+b+c+d];
}
```
Annoucements

Seating in classes

- Currently # enrollment is around 25-26
- The classroom is supposed to hold up to 36
- When the classroom is full, the seating priority should be given to students enrolled in the class.
- Any idea to resolve seating issue?
Annoucements

Seating in classes

- Any idea to resolve seating issue?

Homework #1

- How is it going?
- Any questions?
Projects for BIOSTAT815

Principles

- Project can be done in pairs
- Single-individual project is possible, but will be graded in the same basis with pair-of-individuals projects.
- Each project has different levels of difficulty, which will be accounted for in the evaluation.
- Suggestions of new projects will be welcomed (subject to discussion with the instructor).
Projects for BIOSTAT815

Action Items

- Rank the project preference (for every project)
- Nominate name(s) to perform the project in pairs, if desired.
- E-mail to hmkang@umich.edu, with title ”815 Project - [your name]” by Friday 11:59pm.
1. MCMC-based p-values of large contingency table

**Input**  An $I \times J$ contingency table

**Output**  p-values of the contingency table, based on MCMC method

**Note**  Need to demonstrate that the method provides p-values consistent to exact method when possible to compute
List of 815 Projects

1. MCMC-based p-values of large contingency table
   
   **Input** An $I \times J$ contingency table
   
   **Output** p-values of the contingency table, based on MCMC method
   
   **Note** Need to demonstrate that the method provides p-values consistent to exact method when possible to compute

2. Rapid evaluation of logistic regression models
   
   **Input** $n \times p$ matrix $X$ and binary response variables $y$ of size $n.$
   
   **Output** MLE $\beta$, $SE(\beta)$ and p-values $\text{logit}[\Pr(y = 1)] = X\beta$
   
   **Note** Need to be fast to be able to apply for a large number of tests simultaneously
List of 815 Projects

3. HMM-based profile alignment of sequence pairs

**Input**  Two sequences of \( \{A, C, G, T\} \)

**Output**  HMM-based probabilistic alignment between the two sequences, and comparison with Smith-Waterman algorithm

**Note**  Allow banded computation for improved efficiency. Multiple sequence alignment algorithms are more than welcomed
### 3. HMM-based profile alignment of sequence pairs

**Input**  Two sequences of \( \{ A, C, G, T \} \)

**Output**  HMM-based probabilistic alignment between the two sequences, and comparison with Smith-Waterman algorithm

**Note**  Allow banded computation for improved efficiency. Multiple sequence alignment algorithms are more than welcomed

### 4. Rapid clustering of gene expression data

**Input**  \( n \times g \) matrix of normalized gene expression across \( n \) samples and \( g \) genes

**Output**  Clusters of genes using at least two clustering methods, among (a) hierachical clustering, (b) \( k \)-means clustering, (c) spectral clustering, (d) E-M clustering, and (e) other robust clustering methods
5. EM-algorithm for genotype calling from intensities

**Input** List of two dimensional intensities across $n$ unrelated samples

**Output** Possible genotype label AA, AB, BB, NN and posterior probability of each individual genotype, based on EM algorithm with mixture of Gaussian or Student $t$
5. **EM-algorithm for genotype calling from intensities**

**Input** List of two dimensional intensities across $n$ unrelated samples

**Output** Possible genotype label AA, AB, BB, NN and posterior probability of each individual genotype, based on EM algorithm with mixture of Gaussian or Student $t$

6. **A Bayesian SNP calling algorithm from sequence data**

**Input** For each individual and genomic position, genotype likelihood, defined as $\Pr(\text{Reads}|G_1 G_2)$, for each possible genotype $G_1 G_2$

**Output** Posterior probability of a position being SNP

**Note** Alternatively, starting from aligned sequence (BAM format) is also possible
7. Short read alignment

**Input**  
Short sequence reads \((n \sim 100)\), and a reference genome up to the size of human genome \((3 \times 10^9)\)

**Output**  
Best possible genomic position to align the sequence onto

**Note**  
OK to mimic existing short aligning software, or have special feature such as statistical alignment into multiple places
List of 815 Projects

7. Short read alignment

**Input**  Short sequence reads \((n \sim 100)\), and a reference genome up to the size of human genome \((3 \times 10^9)\)

**Output**  Best possible genomic position to align the sequence onto

**Note**  OK to mimic existing short aligning software, or have special feature such as statistical alignment into multiple places

8. Solution using MapReduce Framework

**Input**  Any of the problems suggested by 1-7

**Output**  Solution implemented under MapReduce framework

**Note**  For extra credit. MapReduce framework is a scalable parallel programming technique for cloud computing
The flexibility and complexity of C++

**Flexibility of C++ : What C++ offers**

- Both reference and pointer types (unlike C or Java)
- User-defined data type via classes (unlike C)
- Inheritance (unlike C) and multiple inheritance (unlike C or Java)
- Explicit allocation and deallocation of memory (unlike Java)
- Templates that operate with generic types (unlike C or earlier Java)
- And more.. (operator overloading, dynamic polymorphism, etc)
The flexibility and complexity of C++

Flexibility of C++: What C++ offers

- Both reference and pointer types (unlike C or Java)
- User-defined data type via classes (unlike C)
- Inheritance (unlike C) and multiple inheritance (unlike C or Java)
- Explicit allocation and deallocation of memory (unlike Java)
- Templates that operate with generic types (unlike C or earlier Java)
- And more.. (operator overloading, dynamic polymorphism, etc)

Complexity of C++

There is a hoax claiming that the C++ designer Bjarne Stroustrup admitted in an interview that he developed the C++ language solely to create high-paying jobs for programmers, because C language is too easy to distinguish talented programmers from ordinary programmers.
Why use C++ in the class?

C

- C is relatively simple to use
- Library support for basic data structure (array, hash, etc) is limited.
- Limited support on object-oriented programming.
Why use C++ in the class?

C
- C is relatively simple to use
- Library support for basic data structure (array, hash, etc) is limited.
- Limited support on object-oriented programming.

Java (or C#)
- Object-oriented, clear and simple language
- No explicit control on memory management
- Performance can be substantially worse than C/C++ in some applications
Why use C++ in the class?

C++

- Explicit memory control with great performance
- Support from standard template library and other libraries
- High complexity - will use only core features during lectures
  - Classes with member variable, member function, inheritance, and dynamic polymorphism
  - No operator overloading, multiple inheritance, deep/shallow copy
  - Standard Template Library (STL)
  - Other useful libraries
- For advanced use of C++, read Effective C++ or take another programming course.
Classes and user-defined data type

### C++ Class

- A user-defined data type with
  - Member variables
  - Member functions

### An example C++ Class

```cpp
class Point { // definition of a class as a data type
public: // making member variables/functions accessible outside the class
    double x; // member variable
    double y; // another member variable
};
Point p; // A class object as an instance of a data type
p.x = 3.; // assign values to member variables
p.y = 4.;
```
#include <iostream>
#include <cmath>

class Point {
public:
    double x;
    double y;
    double distanceFromOrigin() { // member function
        return sqrt( x*x + y*y );
    }
};

int main(int argc, char** argv) {
    Point p;
    p.x = 3.;
    p.y = 4.;
    std::cout << p.distanceFromOrigin() << std::endl; // prints 5
}
Constructor - A better way to initialize an object

```cpp
#include <iostream>
#include <cmath>

class Point {
public:
    double x;
    double y;

    Point(double px, double py) { // constructor defines here
        x = px;
        y = py;
    }

    // equivalent to -- Point(double px, double py) : x(px), y(py) {}
    double distanceFromOrigin() { return sqrt( x*x + y*y );}
};

int main(int argc, char** argv) {
    Point p(3,4) // calls constructor with two arguments
    std::cout << p.distanceFromOrigin() << std::endl; // prints 5
}
```

January 18th, 2011
More member functions

```cpp
#include <iostream>
#include <cmath>

class Point {
public:
    double x, y;
    Point(double px, double py) { x = px; y = py; }
    double distanceFromOrigin() { return sqrt(x*x + y*y); }
    double distance(Point& p) { // call-by-reference to avoid unnecessary copy
        return sqrt((x-p.x)*(x-p.x) + (y-p.y)*(y-p.y));
    }
    void print() { // print the content of the point
        std::cout << "(" << x << "," << y << ")" << std::endl;
    }
};

int main(int argc, char** argv) {
    Point p1(3,4), p2(15,9);
    p1.print(); // prints (3,4)
    std::cout << p1.distance(p2) << std::endl; // prints 13
}
```

/ assumes that Point is defined before

class Rectangle { // Rectangle
public:
    Point p1, p2; // rectangle is defined by two points
    // initialize by calling constructors of member variables
    Rectangle(double x1, double y1, double x2, double y2) : p1(x1,y1), p2(x2,y2) {}
    Rectangle(Point& a, Point& b) : p1(a), p2(b) {}
    double area() { // area covered by a rectangle
        return (p1.x-p2.x)*(p1.y-p2.y);
    }
};

int main(int argc, char** argv) {
    Point p1(3,4), p2(15,9);
    Rectangle r1(3,4,15,9); // first constructor is called
    Rectangle r2(p1,p2);    // second constructor is called
    std::cout << r1.area() << std::endl; // prints 60
    std::cout << r2.area() << std::endl; // prints 60
    std::cout << r1.p2.print() << std::endl; // prints (15,9)
}
#include <iostream>
#include <cmath>

class Point {
public:
    double x, y;
    Point(double px, double py) { x = px; y = py; }
    double distance(Point& p) { return sqrt( (x-p.x)*(x-p.x) + (y-p.y)*(y-p.y) ); }
    void print() { std::cout << "(" << x << "," << y << ")" << std::endl; }
};

int main(int argc, char** argv) {
    Point p1(3,4);               // static allocation
    Point* pp2 = new Point(5,12); // dynamic allocation
    Point* pp3 = &p1;            // *pp3 == p1
    p1.print();                 // Member function access - prints (3,4)
    pp2->print();               // Member function access via pointer - prints (5,12)
    pp3->print();               // Member function access via pointer - prints (3,4)
    std::cout << "p1.x = " << p1.x << std::endl;          // prints 3
    std::cout << "pp2->x = " << pp2->x << std::endl;      // prints 5
    std::cout << "(*pp2).x = " << (*pp2).x << std::endl; // same to pp2->x
    delete pp2;                 // allocated memory must be deleted
}
// assume that Point class defined above

Point* foo(double x, double y) {
    Point p(x, y); // local variable in stack space. valid only within a function
    return &p; // WARNING: return value is invalid if function terminates
}

Point* bar(double x, double y) {
    Point* p = new Point(x, y); // heap spaces
    return p; // object is alive until delete is called
}

int main(int argc, char** argv) {
    Point* p1 = foo(3, 4); // p1 is invalid after foo() is terminated.
    Point* p2 = bar(5, 12); // p2 is a valid pointer
    p1->print(); // prints arbitrary value (may cause fatal error)
    p2->print(); // prints (5,12)
    delete p2; // object created by 'new' must be 'delete'd.
}
Using Standard Template Library (STL)

Why STL?

- Included in the C++ Standard Library
- Allows to use key data structure and I/O interface easily
- Objects behaves like built-in data types

Key classes

- Strings library: `<string>`
- Input/Output Handling: `<iostream>`, `<fstream>`, `<sstream>`
- Variable size array: `<vector>`
- Other containers: `<set>`, `<map>`, `<stack>`
# STL in practice

## sortedEcho.cpp

```cpp
#include <iostream>
#include <string>
#include <vector>

int main(int argc, char** argv) {
    std::vector<std::string> vArgs; // vector of strings
    for(int i=1; i < argc; ++i) {
        vArgs.push_back(argv[i]); // append each arguments to the vector
    }
    std::sort(vArgs.begin(),vArgs.end()); // sort the vector in alphanumerical order
    std::cout << "Sorted arguments :"; // print the sorted arguments
    for(int i=0; i < vArgs.size(); ++i) { std::cout << " " << vArgs[i]; }  
    std::cout << std::endl;
    return 0;
}
```

## A running example

```
user@host:~/> ./sortedEcho Hello, World! hello, world! 2 3 5 60 1
Sorted arguments : 1 2 3 5 60 Hello, World! hello, world!
```
More STL example

argsCount.cpp - List unique words with counts

```cpp
#include <iostream>
#include <string>
#include <map>

int main(int argc, char** argv) {
    std::map<std::string, int> stringCounts; // contains a pair of string and counts
    for(int i=1; i < argc; ++i) // build (word,count) map
    {  ++(stringCounts[argv[i]]); } // map[key] = value
    for(std::map<std::string, int>::iterator i = stringCounts.begin();
        i != stringCounts.end(); ++i) // iterate over the map and print (key,value) pairs
    { std::cout << i->second << " " << i->first << std::endl; }
    return 0;
}
```

A running example

```
user@host:~/> ./argsCount here moo moo there moo moo here moo there moo here there moo moo
3 here
8 moo
3 there
```

Hyun Min Kang

Biostatistics 615/815 - Lecture 4

Januray 18th, 2011 23 / 38
More STL example

argsCount.cpp - List unique words with counts

```cpp
#include <iostream>
#include <string>
#include <map>

int main(int argc, char** argv) {
    std::map<std::string, int> stringCounts; // contains a pair of string and counts
    for(int i=1; i < argc; ++i) // build (word,count) map
        ++(stringCounts[argv[i]]); // map[key] = value
    for(std::map<std::string, int>::iterator i = stringCounts.begin();
        i != stringCounts.end(); ++i) // iterate over the map and print (key,value) pairs
        std::cout << i->second << " " << i->first << std::endl;
    return 0;

8 moo
3 there
```
STL Use in **INSERTIONSORT** Algorithm

**insertionSort.cpp - printArray() function**

```cpp
// print each element of array to the standard output
void printArray(std::vector<int>& A) { // call-by-reference
    for(int i=0; i < A.size(); ++i) {
        std::cout << A[i];
    }
    std::cout << std::endl;
}
```

Hyun Min Kang

Biostatistics 615/815 - Lecture 4

Januray 18th, 2011 24 / 38
STL Use in **INSERTIONSORT** Algorithm

```cpp
// perform insertion sort on A
void insertionSort(std::vector<int>& A) { // call-by-reference
    for(int j=1; j < A.size(); ++j) { // 0-based index
        int key = A[j]; // key element to relocate
        int i = j-1; // index to be relocated
        while( (i >= 0) && (A[i] > key) ) { // find position to relocate
            A[i+1] = A[i]; // shift elements
            --i; // update index to be relocated
        }
        A[i+1] = key; // relocate the key element
    }
}
```
STL use in \textbf{InsertionSort} Algorithm

\texttt{insertionSort.cpp - main()} function

\begin{verbatim}
#include <iostream>
#include <vector>

void printArray(std::vector<int>& A);       // declared here, defined later
void insertionSort(std::vector<int>& A);    // declared here, defined later
int main(int argc, char** argv) {
    std::vector<int> v; // contains array of unsorted/sorted values
    int tok;            // temporary value to take integer input
    while ( std::cin >> tok ) // read an integer from standard input
        v.push_back(tok)    // and add to the array
    std::cout << "Before sorting:";
    printArray(v);       // print the unsorted values
    insertionSort(v);    // perform insertion sort
    std::cout << "After sorting:";
    printArray(v);       // print the sorted values
    return 0;
}
\end{verbatim}
Recursion

Definition of recursion
Recursion

Defintion of recursion

Recursion  See "Recursion".
Recursion

Defintion of recursion

Recursion See "Recursion".

Another defintion of recursion

Recursion If you still don’t get it, see: "Recursion"
Recursion

Defintion of recursion

Recursion  See ”Recursion”.

Another definition of recursion

Recursion  If you still don’t get it, see: ”Recursion”

Key components of recursion

• A function that is part of its own definition
• Terminating condition (to avoid infinite recursion)
Example of recursion

## Factorial

```cpp
int factorial(int n) {
    if ( n == 0 )
        return 1;
    else
        return n * factorial(n-1); // tail recursion - can be transformed into loop
}
```
Example of recursion

**Factorial**

```cpp
def factorial(int n):
    if n == 0:
        return 1
    else:
        return n * factorial(n-1)  # tail recursion - can be transformed into loop
```

**towerOfHanoi**

```cpp
def towerOfHanoi(n, s, i, d):
    if n > 0:
        towerOfHanoi(n-1, s, d, i);  # recursively move n-1 disks from s to i
        std::cout << "Disk " << n << " : " << s << " -> " << d << std::endl;
        towerOfHanoi(n-1, i, s, d);  # recursively move n-1 disks from i to d
```
Euclid’s algorithm

Algorithm \text{GCD}

\textbf{Data:} Two integers \(a\) and \(b\)

\textbf{Result:} The greatest common divisor (GCD) between \(a\) and \(b\)

\textbf{if} \(a\) divides \(b\) \textbf{then}

\hspace{1em} return \(a\)

\textbf{else}

\hspace{1em} Find the largest integer \(t\) such that \(at + r = b\);

\hspace{1em} return \(\text{GCD}(r,a)\)

\textbf{end}
Euclid’s algorithm

Algorithm GCD

**Data:** Two integers $a$ and $b$

**Result:** The greatest common divisor (GCD) between $a$ and $b$

if $a$ divides $b$ then
   return $a$
else
   Find the largest integer $t$ such that $at + r = b$;
   return $GCD(r, a)$
end

Function gcd()

```cpp
int gcd (int a, int b) {
    if ( a == 0 ) return b; // equivalent to returning a when b % a == 0
    else return gcd( b % a, a );
}
```
A running example of Euclid’s algorithm

Function gcd()

```c
int gcd (int a, int b) {
    if (a == 0) return b; // equivalent to returning a when b % a == 0
    else return gcd(b % a, a);
}
```

Evaluation of gcd(477, 246)

gcd(477, 246)
A running example of Euclid’s algorithm

**Function gcd()**

```c
int gcd (int a, int b) {
    if (a == 0) return b; // equivalent to returning a when b % a == 0
    else return gcd(b % a, a);
}
```

**Evaluation of gcd(477,246)**

gcd(477, 246)
  
gcd(231, 246)
A running example of Euclid’s algorithm

**Function gcd()**

```cpp
int gcd (int a, int b) {
    if ( a == 0 ) return b; // equivalent to returning a when b % a == 0
    else return gcd( b % a, a );
}
```

**Evaluation of gcd(477,246)**

gcd(477, 246)
    gcd(231, 246)
        gcd(15, 231)
A running example of Euclid’s algorithm

Function gcd()

```cpp
int gcd (int a, int b) {
    if (a == 0) return b; // equivalent to returning a when b % a == 0
    else return gcd(b % a, a);
}
```

Evaluation of gcd(477, 246)

gcd(477, 246)
  gcd(231, 246)
    gcd(15, 231)
      gcd(6, 15)
```
A running example of Euclid’s algorithm

**Function gcd()**

```c
int gcd (int a, int b) {
    if ( a == 0 ) return b; // equivalent to returning a when b % a == 0
    else return gcd( b % a, a );
}
```

**Evaluation of gcd(477,246)**

\[
\begin{align*}
gcd(477, 246) \\
gcd(231, 246) \\
gcd(15, 231) \\
gcd(6, 15) \\
gcd(3, 6)
\end{align*}
\]
A running example of Euclid’s algorithm

**Function gcd()**

```cpp
int gcd (int a, int b) {
    if (a == 0) return b; // equivalent to returning a when b % a == 0
    else return gcd(b % a, a);
}
```

**Evaluation of gcd(477, 246)**

\[
gcd(477, 246) = gcd(231, 246) = gcd(15, 231) = gcd(6, 15) = gcd(3, 6) = gcd(0, 3) = 3
\]
A running example of Euclid’s algorithm

Function gcd()

```c
int gcd (int a, int b) {
    if (a == 0) return b; // equivalent to returning a when b % a == 0
    else return gcd(b % a, a);
}
```

Evaluation of gcd(477, 246)

gcd(477, 246)
  gcd(231, 246)
    gcd(15, 231)
      gcd(6, 15)
        gcd(3, 6)
          gcd(0, 3)
gcd(477, 246) == 3
Divide-and-conquer algorithms

Solve a problem recursively, applying three steps at each level of recursion

**Divide** the problem into a number of subproblems that are smaller instances of the same problem

**Conquer** the subproblems by solving them recursively. If the subproblem sizes are small enough, however, just solve the subproblems in a straightforward manner.

**Combine** the solutions to subproblems into the solution for the original problem
Binary Search

```cpp
// assuming a is sorted, return index of array containing the key, // among a[start...end]. Return -1 if no key is found
int binarySearch(std::vector<int>& a, int key, int start, int end) {
    if ( start > end ) return -1; // search failed
    int mid = (start+end)/2;
    if ( key == a[mid] ) return mid; // terminate if match is found
    if ( key < a[mid] ) // divide the remaining problem into half
        return binarySearch(a, key, start, mid-1);
    else
        return binarySearch(a, key, mid+1, end);
}
```
Recursive Maximum

```c++
// find maximum within an a[start..end]
int findMax(std::vector<int>& a, int start, int end) {
    if ( start == end ) return a[start]; // conquer small problem directly
    else {
        int mid = (start+end)/2;
        int leftMax = findMax(a,start,mid); // divide the problem into half
        int rightMax = findMax(a,mid+1,end);
        return ( leftMax > rightMax ? leftMax : rightMax ); // combine solutions
    }
}
```
Merge Sort

Divide and conquer algorithm

Divide: Divide the $n$ element sequence to be sorted into two subsequences of $n/2$ elements each

Conquer: Sort the two subsequences recursively using merge sort

Combine: Merge the two sorted subsequences to produce the sorted answer
mergeSort.cpp - main()

```cpp
#include <iostream>
#include <vector>
#include <climits>

void mergeSort(std::vector<int>& a, int p, int r); // defined later

void printArray(std::vector<int>& A); // same as insertionSort
// same to insertionSort.cpp except for one line

int main(int argc, char** argv) {
    std::vector<int> v;
    int tok;
    while ( std::cin >> tok ) {
        v.push_back(tok);
    }
    std::cout << "Before sorting: ";
    printArray(v);
    mergeSort(v, 0, v.size()-1); // differs from insertionSort.cpp
    std::cout << "After sorting: ";
    printArray(v);
    return 0;
}
```
mergeSort.cpp - merge() function

// merge piecewise sorted a[p..q] a[q+1..r] into a sorted a[p..r]
void merge(std::vector<int>& a, int p, int q, int r) {
    std::vector<int> aL, aR; // copy a[p..q] to aL and a[q+1..r] to aR
    for(int i=p; i <= q; ++i) aL.push_back(a[i]);
    for(int i=q+1; i <= r; ++i) aR.push_back(a[i]);
    aL.push_back(INT_MAX); // append additional value to avoid out-of-bound
    aR.push_back(INT_MAX);
    // pick smaller one first from aL and aR and copy to a[p..r]
    for(int k=p, i=0, j=0; k <= r; ++k) {
        if ( aL[i] <= aR[j] ) {
            a[k] = aL[i];
            ++i;
        }
        else {
            a[k] = aR[j];
            ++j;
        }
    }
}
mergeSort.cpp - mergeSort() function

```cpp
void mergeSort(std::vector<int>& a, int p, int r) {
    if ( p < r ) {
        int q = (p+r)/2; // find a point to divide the problem
        mergeSort(a, p, q); // divide-and-conquer
        mergeSort(a, q+1, r); // divide-and-conquer
        merge(a, p, q, r);  // combine the solutions
    }
}
```
