

Practical Introduction

Introduction to Linux for Sequencing Workshop

December 8, 2014

Mary Kate Wing
University of Michigan
Center for Statistical Genetics

Goals of This Session

- No food/drink in this room
- Learn how to logon to the workshop Linux machine
- Become familiar with basic Linux commands that will be used during the workshop
- Ask questions at any point

Logon to Windows

- In front of you are Windows machines
 - Username/password on right-hand monitor
- Will connect to the workshop Linux machine from Windows
 - Tools to connect already installed

Everyone logged in?

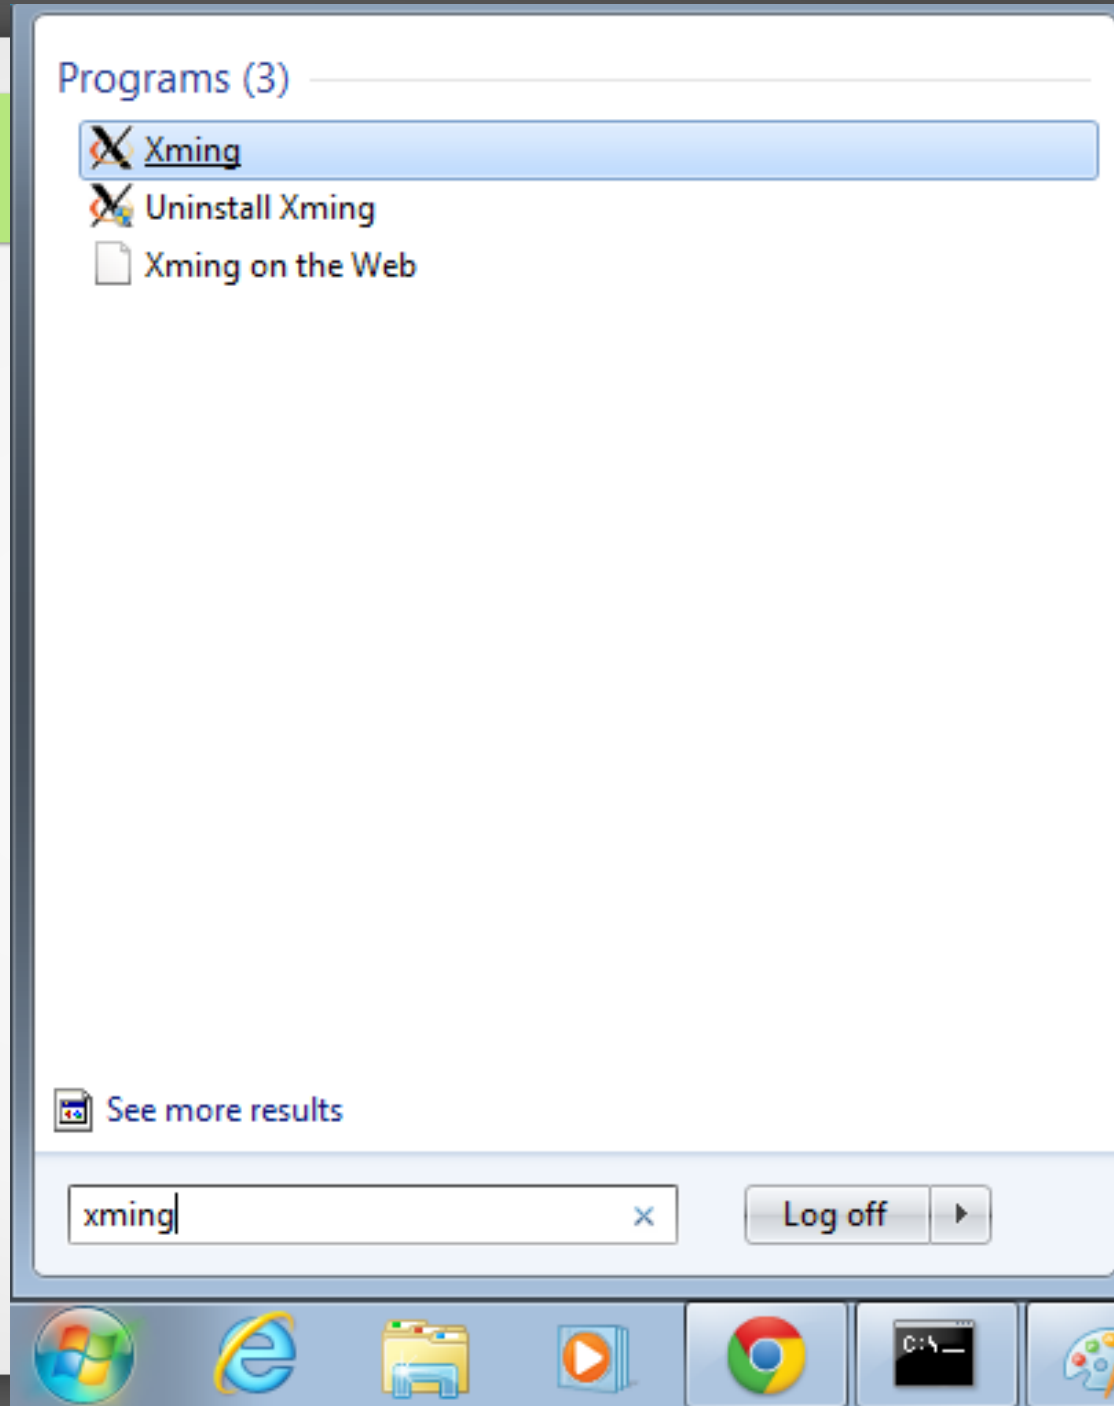

Connecting to Workshop Machine

- PuTTY - connect to Linux machine
 - terminal emulator
 - run commands
- xming - X11 display server
 - Allows you to open pdfs, etc from putty
- Instructions at start of each practical
 - So don't worry about memorizing it

Start xming

1. Start->search
2. Type:
xmingSelect :
Xming

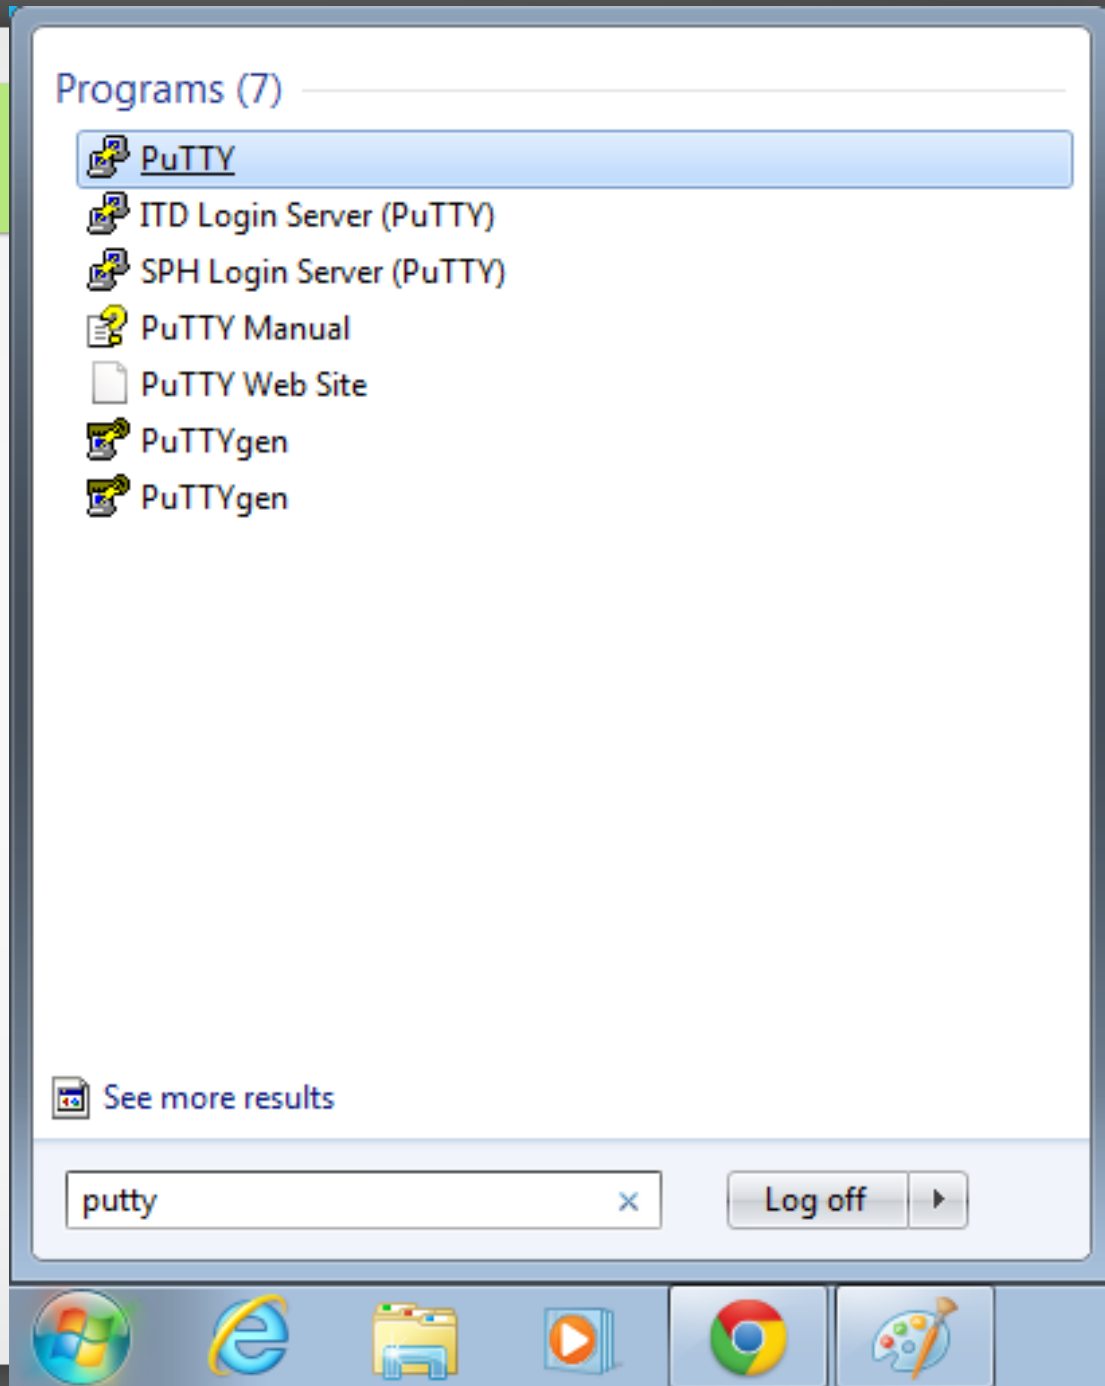

Nothing will
happen, but it is
started

Open PuTTY

1. Start->search
2. Type: putty
3. Select : PuTTY

This will open a
PuTTY
Configuration
window

PuTTY

- Enter Host Name:
 - seqshop-server.sph.umich.edu

PuTTY

Logon to seqshop-server

- Enter your provided Linux username and password
- You should now have a terminal on the seqshop-server Linux machine
 - If you ever want/need a 2nd terminal, redo the PuTTY steps
- Does everyone have a terminal?

Terminal Basics

- Command-line prompt
 - You will start in your “home” directory
 - `/net/seqshop-server/home/mktrost`
 - (your username instead)
 - `~`
 - Each have your own
 - You have permission to read/write
 - Your inputs & outputs go here
- How to figure out where you are:
 - `pwd`
 - `/net/seqshop-server/home/mktrost`

Directory Contents

- `ls`
 - Lists files/sub-directories
 - What do you have in your directory?
 - `examples.desktop`
 - Personal Genome directory: `SampleXX/NA12878`

Up-arrow will go to the previous command

Directory/File Permissions

- `ls -l`
 - 'd' - directory; '-' - file
 - r/w/x: read, write, or execute
 - 3 sets of values
 - user/group/everyone
 - USER & GROUP are both set to you
 - Personal Data is read only by you

Looking at a Different Directory

- Enter the path of the directory you want to look at
 - `ls ~mktrost/seqshop/`
 - `ls Sample*`
 - `*` is wildcard
- Does not change you to a different directory
 - Still in same place you were before
 - Check with `pwd`

Change/Move to New Directory

- `cd Sample*`
 - (or `cd NA12878`)
 - `ls`
 - We will look at this more later
- `cd`
 - takes you back to your home directory

Create New Directory

- `mkdir testDir`
- `mkdir -p testDir/dir1/dir2`
 - Create parent directories if they don't exist
 - Do not generate error if directory exists
 - `ls testDir`
 - `ls testDir/dir1`
- **Rename/Move**
 - `mv testDir testDir1`
 - `ls`

Up a Directory

- . - current directory
- .. - up 1 directory
 - `ls ../..`
 - Lists contents of 2 directories up
 - `cd ..`
 - Move up 1 directory
 - `cd`
 - Move to home directory

Variables

- Save from typing long path/command
 - In BASH (the shell you are running):
 - `export VARNAME=value`
 - Allows you to use `${VARNAME}` as shorthand
 - Can easily change the value without changing commands
 - Useful for scripts/seqshop copy/paste commands
 - Try it
 - `ls $TEST`
 - `${TEST}` is not set, so is blank, so just lists current directory
 - `export TEST=~ /testDir1`
 - `ls ${TEST}`
 - Should see contents of testDir1

Look at a file

- `less`
 - Use arrow (up/down/left/right) keys to scroll through file
 - Use *space bar* to jump down a page
 - `-S` - prevents line wrap
 - Use 'q' to exit
 - `zless` - read compressed
- `cat`
 - `zcat`
- `more`

Look at parts of a file

- `head` - look at start of the file
 - `-n K` - print first K lines (default 10)
 - `-n -K` - print all but the last K lines
- `tail` - look at end of the file
 - `-n K` - print last K lines (default 10)
 - `-n +K` - print starting with the Kth line

Extracting Specific Columns

- `cut` - remove sections from each line of files
 - `-d DELIM` - use DELIM as delimiter rather than TAB
 - `-f N1,N2` - print fields N1 & N2 (and lines with no delimiter)

Additional commands

- Search

- `grep` - print lines matching a pattern
 - `-v` : lines without pattern

- Word Count

- `wc`
 - `-l` : line count

String commands together

- | - pipe - use output of previous command as input to next command
 - `tail -n+300 file | head -n 5`
 - Output starting at line 300, but only read 5 lines

String commands together

- `zcat ${OUT}/split/chr22/chr22.filtered.PASS.vcf.gz |grep -v "^#" | cut -f 7| grep -v "PASS"`
 - `zcat ...`: uncompress the zipped VCF
 - `'|'`: takes the output of one command and sends it as input to the next
 - `grep -v "^#"`: exclude any lines that start with "#"
 - `cut -f 7`: extract the 7th column
 - `grep -v "PASS"`: exclude any rows that have a "PASS" in the 7th column

Screen

- Leave commands running after you logout
 - Start Screen: `screen`
 - Detach from screen session: `Ctrl-a d`
 - Logout as normal
- Resume session later
 - login
 - Resume: `screen -r`
- Exit
 - `exit`
- Scroll
 - Scroll: `Ctrl-a Esc`
 - Exit Scroll: `Esc`

Run Workshop Later

- Instructions/tutorial data will be on wiki by end of next week
 - `wget http://www.sph.umich.edu/csg/mktrost/seqshopExample.tar.gz`
 - `tar xvf seqshopExample.tar.gz`
- Build C++
 - `make`

Useful Links
